Metaprogramming with Macros

Eugene Burmako

École Polytechnique Fédérale de Lausanne http://scalamacros.org/

10 September 2012

What are macros?

Macros in programming languages:

- C macros
- Lisp macros
- **.**..

What is the underlying concept?

What are macros?

Macros in programming languages:

- C macros
- ▶ Lisp macros
- **.**..

What is the underlying concept?

Macros realize the notion of textual abstraction:

- Recognize pieces of text that match a specification
- Replace them according to a procedure

Why macros?

Work with syntax trees, therefore are not bound by the semantics of the underlying programming language

Use cases:

- Deeply embedded DSLs (database access, testing)
- Optimization (programmable inlining, fusion)
- Analysis (integrated proof-checker)
- Effects (effect containment and propagation)
- **.**..

Macrology

- Notation
- ► Bindings
- Typechecking
- ► Syntax extensibility
- ▶ ..

Outline

The prelude of macros

The chapter of bindings

The trilogy of tongues

The vision of the days to come

A detour: how Lisp works

```
(if (calculate)
  (print "success")
  (error "does not compute"))
```

- ► S-expressions: atoms and lists
- print and error are one-argument functions
- calculate is a zero-argument function
- ▶ if is a special form
- ► All values can be used in conditions

Anaphoric if

```
(aif (calculate)
  (print it)
  (error "does not compute"))
```

```
(let* ((temp (calculate))
          (it temp))
  (if temp
          (print it)
          (error "does not compute")))
```

The aif macro

```
(aif (calculate)
  (print it)
  (error "does not compute"))
(defmacro aif args
```

```
(let* ((temp (calculate))
          (it temp))
(if temp
          (print it)
          (error "does not compute")))
```

Low-level implementation

```
(aif (calculate)
 (print it)
  (error "does not compute"))
(defmacro aif args
  (list 'let* (list (list 'temp (car args))
                     (list 'it 'temp))
     (list 'if 'temp
       (cadr args)
       (caddr args))))
(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Quasiquoting: static template

```
(aif (calculate)
 (print it)
  (error "does not compute"))
(defmacro aif args
 '(let* ((temp .....)
          (it temp))
     (if temp
       . . . . . . . . . . . .
       .....)
(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Quasiquoting: dynamic holes

```
(aif (calculate)
 (print it)
  (error "does not compute"))
(defmacro aif args
  '(let* ((temp ,(car args))
          (it temp))
     (if temp
       ,(cadr args)
       (caddr args))
(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Macro by example (MBE)

```
(aif (calculate)
 (print it)
  (error "does not compute"))
(defmacro+ aif
  (aif cond then else)
  (let* ((temp cond)
         (it temp))
    (if temp
        then
        else)))
(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Interlude

- Macros are functions that transform syntax objects
- Quasiquotes = static templates + dynamic holes
- Impressive power for minimal investments from the compiler

Outline

The prelude of macros

The chapter of bindings

The trilogy of tongues

The vision of the days to come

The aif macro is buggy

The aif macro is buggy

```
(aif (calculate)
 (print it)
 (error "does not compute"))
(defmacro+ aif
  (aif cond then else)
 (let* ((temp cond)
         (it temp))
    (if temp then else)))
(let* ((temp (calculate))
       (it temp))
 (if temp
    (print it)
    (error "does not compute")))
```

Bug #1: Violation of hygiene

```
(let ((temp 451°F))
  (aif (calculate)
    (print it)
    (print temp)))
(defmacro+ aif
  (aif cond then else)
  (let* ((temp cond)
         (it temp))
    (if temp then else)))
(let ((temp 451°F))
  (let* ((temp (calculate))
         (it temp))
    (if temp
      (print it)
      (print temp))))
```

Bug #2: Violation of referential transparency

```
(let ((if hijacked))
  (aif (calculate)
    (print it)
    (error "does not compute")))
(defmacro+ aif
  (aif cond then else)
  (let* ((temp cond)
         (it temp))
    (if temp then else))) ;; core if
(let ((if hijacked))
  (let* ((temp (calculate))
         (it temp))
    (if temp ;; hijacked if
      (print it)
      (error "does not compute"))))
```

Old school solution

Outline

The prelude of macros

The chapter of bindings

The trilogy of tongues

The vision of the days to come

Three macro-enabled languages

Template Meta-programming for Haskell [Template Haskell] by Tim Sheard and Simon Peyton Jones

Meta-programming in Nemerle [Nemerle] by Kamil Skalski, Michal Moskal and Pawel Olszta.

Keeping it Clean with Syntax Parameters [Racket] by Eli Barzilay, Ryan Culpepper and Matthew Flatt

All three languages:

- ▶ Solve the problems of hygiene and referential transparency
- Do this in their own interesting ways

Template Haskell: The aif macro

```
$(aif [| calculate |]
  [| putStrLn (show it) |]
  [| error "does not compute" |])

aif :: Q Exp -> Q Exp -> Q Exp -> Q Exp
aif cond then' else' =
  [| let temp = $cond
        it = temp
  in if temp /= 0 then $then' else $else' |]
```

- No dedicated concept of macros
- Any function that returns an Exp can work as a macro
- Macro expansions are explicitly triggered with \$
- ▶ There are quasiquotes [| ... |] and unquotes \$expr

Template Haskell: The perils of hygiene

```
$(aif [| calculate |]
  [| putStrLn (show it) |]
  [| error "does not compute" |])
aif :: Q Exp -> Q Exp -> Q Exp -> Q Exp
aif cond then' else' =
  [| let temp = $cond
         it = temp
     in if temp /= 0 then $then' else $else' |]
let temp_a1mx = calculate
    it_a1my = temp_a1mx
in if (temp_a1mx /= 0)
   then putStrLn (show it)
   else error "does not compute"
```

Not in scope: 'it'

24

Template Haskell: The Q monad

```
aif cond then' else' =
  [| let temp = $cond
         it = temp
     in if temp /= 0 then $then' else $else' |]
aif :: Q Exp -> Q Exp -> Q Exp -> Q Exp
aif cond' then' else' =
    do { ...
       ; temp <- newName "temp"
       ; it <- newName "it"
       ; let notEq = mkNameG_v "ghc-prim" "GHC.Classes" "/="
         in return (LetE ... (CondE (... then' else')) ...)
```

Template Haskell: Breaking hygiene

```
$(aif [| calculate |]
  [| putStrLn (show $(dyn "it")) |]
  [| error "does not compute" |])
aif :: Q Exp -> Q Exp -> Q Exp -> Q Exp
aif cond then' else' =
  [ let temp = $cond
         it = temp
     in if temp /= 0 then $then' else $else' []
let temp_a1mx = calculate
    it_a1my = temp_a1mx
in if (temp_a1mx /= 0)
   then putStrLn (show it_a1my)
   else error "does not compute"
```

Template Haskell: Summary

- ► Template Haskell is auto hygienic and referentially transparent
- ▶ The Q monad takes care of names
- ► Sometimes we need to break hygiene

Nemerle: The aif macro

```
aif(calculate,
  WriteLine(it),
  throw Exception("does not compute"))
macro aif(cond, then, else_) {
  <[
    def temp = $cond;
    def it = temp;
    if (temp != 0) $then else $else_
  ]>
```

```
Nemerle: The perils of hygiene
aif(calculate,
  WriteLine(it),
  throw Exception("does not compute"))
macro aif(cond, then, else_) {
  ۲۲
    def temp = $cond;
    def it = temp;
    if (temp != 0) $then else $else_
  1>
def calculate = 42;
def temp_1087 = calculate;
def it_1088 = temp_1087;
if (temp_1087 != 0) WriteLine(it) else throw Exception("...")
```

error: unbound name 'it'

```
def calculate = 42:
aif(calculate,
  WriteLine(it).
  throw Exception("does not compute"))
macro aif(cond, then, else_) {
  <۲
    def temp = $cond;
    def it = temp;
    if (temp != 0) $then else $else_
 ]>
def calculate = 42:
def temp = calculate;
def it = temp;
if (temp != 0) WriteLine(it) else throw Exception("...")
```

```
def calculate = 42:
                                     // vanilla color
aif(calculate,
  WriteLine(it),
  throw Exception("does not compute"))
macro aif(cond, then, else_) {
  <۲
    def temp = $cond;
    def it = temp;
    if (temp != 0) $then else $else_
 ]>
def calculate = 42:
def temp = calculate;
def it = temp;
if (temp != 0) WriteLine(it) else throw Exception("...")
```

```
def calculate = 42:
                                    // vanilla color
aif(calculate,
  WriteLine(it),
  throw Exception("does not compute"))
macro aif(cond, then, else_) { // expansion color
  <۲
    def temp = $cond;
    def it = temp;
    if (temp != 0) $then else $else_
 ]>
def calculate = 42:
def temp = calculate;
def it = temp;
if (temp != 0) WriteLine(it) else throw Exception("...")
```

```
def calculate = 42:
                                    // vanilla color
aif(calculate,
  WriteLine(it),
  throw Exception("does not compute"))
macro aif(cond, then, else_) { // expansion color
  <۲
    def temp = $cond;
    def it = temp;
    if (temp != 0) $then else $else_
 1>
def calculate = 42:
                                    // bind using colors
def temp = calculate;
def it = temp;
if (temp != 0) WriteLine(it) else throw Exception("...")
```

```
def calculate = 42:
                                    // vanilla color
aif(calculate,
 WriteLine(it),
 throw Exception("does not compute"))
macro aif(cond, then, else_) { // expansion color
 <۲
   def temp = $cond;
   def $("it": usesite) = temp; // recolor the variable
    if (temp != 0) $then else $else_
 ]>
def calculate = 42:
                                    // bind using colors
def temp = calculate;
def it = temp;
if (temp != 0) WriteLine(it) else throw Exception("...")
```

Nemerle: Summary

- ▶ Nemerle takes care of hygiene with a coloring algorithm
- No complex translation algorithms are necessary
- ► As another bonus programmer can fine-tune colors with MacroColors
- Referential transparency works as well

Racket

A Lisp, descendent from Scheme

25 years of hygienic macros, a bunch of macro systems

Language features written using macros (classes, modules, etc)

Racket

```
(aif (calculate)
  (print it)
  (error "does not compute"))
(define-syntax (aif stx)
  (syntax-case stx ()
    ((aif cond then else)
       #'(let ((temp cond)
               (it temp)))
           (if temp then else)))))
```

Racket

```
(aif (calculate)
 (print it)
 (error "does not compute"))
(define-syntax (aif stx)
  (syntax-case stx ()
    ((aif cond then else)
       #'(let ((temp cond)
               (it temp)))
           (if temp then else)))))
(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Racket

```
(aif (calculate)
 (print it)
 (error "does not compute"))
(define-syntax (aif stx)
  (syntax-case stx ()
    ((aif cond then else)
     (with-syntax ((it (datum->syntax #'aif 'it)))
       #'(let ((temp cond)
               (it temp)))
           (if temp then else))))))
(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Doesn't scale

```
(aunless (not (calculate))
  (print it)
  (error "does not compute"))
(define-syntax (aunless stx)
  (syntax-case stx ()
    ((aunless cond then else)
     #'(aif (not cond) then else))))
(let* ((temp (not (not (calculate))))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Doesn't scale

```
(aunless (not (calculate))
  (print it)
  (error "does not compute"))
(define-syntax (aunless stx)
  (syntax-case stx ()
    ((aunless cond then else)
     #'(aif (not cond) then else))))
(let* ((temp (not (not (calculate))))
       (it temp))
 (if temp
    (print it)
    (error "does not compute")))
```

Doesn't scale

```
(aunless (not (calculate))
  (print it)
  (error "does not compute"))
(define-syntax (aunless stx)
  (syntax-case stx ()
    ((aunless cond then else)
    #'(aif (not cond) then else))))
(let* ((temp (not (not (calculate))))
       (it temp))
 (if temp
    (print it)
    (error "does not compute")))
```

Solution: dynamic variables

Summary: overall

- ► There are algorithms that take care of hygiene and referential transparency
- ► These algorithms can work in automatic mode, but are flexible enough to give the programmer full control
- ► Like a silver bullet
- ▶ Nevertheless sometimes even better solutions come from integration with language features

Outline

The prelude of macros

The chapter of bindings

The trilogy of tongues

The vision of the days to come

scalamacros.org

- ► Since this semester Scala has macros
- ► Even better: macros are an official part of the language in the next production release 2.10.0
- Now it's time to put the pens down and think about the future

def serialize[T](x: T): Pickle

```
trait Serializer[T] {
  def write(pickle: Pickle, x: T): Unit
}
def serialize[T](x: T)(s: Serializer[T]): Pickle
```

```
trait Serializer[T] {
  def write(pickle: Pickle, x: T): Unit
}

def serialize[T](x: T)(implicit s: Serializer[T]): Pickle

implicit object ByteSerializer extends Serializer[Byte] {
  def write(pickle: Pickle, x: Byte) = pickle.writeByte(x)
}
```

```
trait Serializer[T] {
  def write(pickle: Pickle, x: T): Unit
}
def serialize[T](x: T)(implicit s: Serializer[T]): Pickle
implicit def generator: Serializer[T] = macro impl[T]
```

Research proposal

Marry macros and high-level language features:

- lacktriangleright Macros + functions o programmable inlining, specialization, fusion
- ► Macros + annotations → code contracts
- ► Macros + path-dependent types → controlled effects
- ► Macros + implicits → static verification
- **.**.
