Macros

Macros

Macros realize the notion of textual abstraction.

Macros

Macros realize the notion of textual abstraction.

Textual abstraction:

- ▶ Recognize pieces of text that match a specification
- ▶ Replace them according to a procedure

Example

```
(let (x 42) (print x))
```

```
((lambda (x) (print x)) 42)
```

Example

```
(let (x 42) (print x))

(defmacro let args

((lambda (x) (print x)) 42)
```

Example

```
(let (x 42) (print x))

(defmacro let args
  (cons
   (cons 'lambda
         (cons (list (caar args))
               (cdr args)))
   (cdar args)))

((lambda (x) (print x)) 42)
```

Example

```
(let (x 42) (print x))

(defmacro let args
  (cons
   (cons 'lambda
         (cons (list (caar args))
               (cdr args)))
   (cdar args)))

((lambda (x) (print x)) 42)
```

Why macros?

- Deeply embedded DSLs (database access, testing)

- Optimization (programmable inlining, fusion)

- Analysis (integrated proof-checker)

- Effects (effect containment and propagation)

- ...

Today's talk

Macrology is vast:

- ▶ Notation

- ▶ Variable capture

- ▶ Typechecking meta-programs

- ▶ Syntax extensibility

- ▶ ...

Today's talk

Macrology is vast:

- ▶ Notation

- ▶ Variable capture

- ▶ Typechecking meta-programs

- ▶ Syntax extensibility

- ▶ ...

Surveyed papers are versatile as well.

Today's talk

Going into all the details is a genuine pleasure

But instead let me tell you a story

Alexandre Dumas

Outline

The story of bindings

Anaphoric `if`

```
(aif (calculate)
  (print it)
  (error "does not compute"))
```

Anaphoric if

```
(aif (calculate)
  (print it)
  (error "does not compute"))
```

```
(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

The `aif` macro

```
(aif (calculate)
  (print it)
  (error "does not compute"))

(defmacro aif args

(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Start with a template

```
(aif (calculate)
  (print it)
  (error "does not compute"))

(defmacro aif args
        (let*              ((temp  (car args))
                             (it  temp))
          (if  temp
             (cadr args)
             (caddr args))))

(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Surround with parentheses

```
(aif (calculate)
  (print it)
  (error "does not compute"))

(defmacro aif args
  (list 'let* (list (list 'temp  (car args))
                    (list 'it 'temp))
    (list 'if 'temp
            (cadr args)
            (caddr args))))

(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Quasiquote

```
(aif (calculate)
  (print it)
  (error "does not compute"))

(defmacro aif args
      `(let*            ((temp ..........)
                         (it  temp))
         (if  temp
            ...........
            ...........)))

(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```

Unquote

```
(aif (calculate)
  (print it)
  (error "does not compute"))

(defmacro aif args
      '(let*            ((temp ,(car args))
                          (it  temp))
          (if  temp
            ,(cadr args)
            ,(caddr args))))

(let* ((temp (calculate))
       (it temp))
  (if temp
    (print it)
    (error "does not compute")))
```
